TITLE: Fluid Flow Controller**Field of the Invention**

The present invention relates to ducts adapted to convey a fluid. Examples of the particular applications of the invention include plumbing systems, air-conditioning

5 ducts, cardiovascular stents, dust precipitators, sound attenuators, mufflers and chambers, exhaust pipes, or ducts where optimized adiabatic expansion or contraction is desired.

Background Art

Generally, devices which direct, influence, or carry fluid flow utilise a duct which has

10 length but is round in cross section, such as water pipe; or flat sided in cross section such as many air conditioning systems. The principal difficulty with previous arrangements however, has been turbulence created within the fluid flow which reduces efficiency. In extreme circumstances, in the case of liquids, the turbulence can result in cavitation, which not only reduces the operational efficiency of the duct 15 but can result in inefficiencies, noise, heating, sedimentation of suspended solids, accelerated electrolysis or corrosion through oxygenation of the fluid, and destructive influences upon the structure of the duct. In cardiovascular devices such as straight-sided stents, deleterious cavitation and / or plaque deposits can occur. In adiabatic expansion devices such as steam or jet turbines, the rate of 20 adiabatic expansion or contraction can be retarded by non optimization of the chamber geometry. This can result in significant inefficiencies.

It is an object of this invention to provide a duct which can facilitate fluid flow by reducing the degree of extraneous turbulence to which the fluid is subjected in its

25 passage through the duct. This object is attained by providing a duct which is intended to induce fluid flow into a pattern of movement wherein the resistance to the fluid flow and turbulence to which the fluid flow is subjected are reduced.

- 2 -

In order to effect this object, the surfaces and/or shape of the duct are intended to provide a fluid pathway which conforms generally to the curve of a logarithmic configuration substantially or in greater part conforming to the Golden Section geometric ratio.

5 All fluids when moving under the forces of nature tend to move in spirals or vortices. These spirals or vortices generally comply with a three-dimensional mathematical logarithmic progression known as the Golden Section or a Fibonacci-like Progression. The invention enables fluids to move over the surfaces of the duct in their naturally preferred way in centripetal vortical rotation, thereby reducing
10 inefficiencies created through turbulence and friction which are normally found in apparatus commonly used for carrying fluid flow.

It may be seen that the more closely a fluid pathway is configured to conform to the Golden Section, the more efficient the duct becomes. However any significant compliance, in part, to the Golden Section will result in improvement over state of
15 the art ducts.

Disclosure of the Invention

Accordingly, the invention resides in a fluid pathway provided with a flow controller in at least a portion of its length wherein the flow controller comprises an active surface capable of influencing the fluid flow through the pathway, the configuration
20 of the active surface conforming to at least one logarithmic curve conforming to the Golden Section.

According to another aspect, the invention resides in a flow controller adapted to be located in the fluid pathway, the flow controller having an active surface adapted to influence the fluid flow, the configuration of the active surface conforming to at least
25 one logarithmic curve conforming to the Golden Section.

- 3 -

According to a preferred feature of the invention the curvature of the active surface is uni-dimensional.

According to a preferred feature of the invention the curvature of the active surface is bi-dimensional.

5 According to a preferred feature of the invention, the active surface has a depth that can vary in accordance with the Golden Section.

According to a preferred feature of the invention the curvature of the active surface is transverse to the central axis of the fluid pathway.

10 According to a further preferred feature of the invention the curvature of the active surface can be in a direction parallel to the central axis.

According to a further preferred feature of the invention the curvature of the active surface is both transverse to the central axis and is parallel to the direction of the central axis to define a three-dimensional surface conforming substantially or in the greater part to the Golden Section.

15 According to a further preferred feature of the invention the fluid pathway has a spiral configuration. According to a preferred embodiment the configuration takes the form of a logarithmic helix or a volute or a whorl.

According to a further preferred feature the cross-sectional area of the duct varies logarithmically substantially or in greater part in conformity to the Golden Section.

20 According to a further preferred feature of the invention the active surface has the configuration conforming to the external configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda. According to particular forms of the invention the active surface conforms to the external configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.

- 4 -

According to a preferred embodiment the active surface has the configuration of the interior of shells of the phylum Mollusca; classes Gastropoda or Cephalopoda. In particular examples of the embodiment the active surface has the configuration of the interior of shells selected from the genera Volutidea, Conidea, Turbinidea, 5 Argonauta, or Nautilus.

According to a preferred feature of the invention, the active surface is adapted to cause rotational motion of fluid within the fluid pathway about the axis of flow of the fluid.

According to a further aspect, the invention resides in a fluid pathway provided with 10 a flow controller in at least a portion of its length wherein the flow controller comprises an active surface adapted to cause rotational motion of fluid within the fluid pathway about the axis of flow of the fluid.

According to a preferred feature of the invention, the configuration of the active surface conforms to at least one logarithmic curve.

15 According to a preferred feature of the invention, the configuration conforms to the Golden Section.

According to a preferred embodiment, the fluid pathway comprises a duct in the form of a cardiovascular stent.

According to a further aspect, the invention resides in a muffler adapted to reduce 20 the volume of noise propagating in a gas flow, the muffler comprising a fluid pathway in the form of an expansion chamber wherein the expansion chamber is configured to induce a vortex in the gas flow, the vortex having a logarithmic spiral.

According to a preferred feature of the invention, the logarithmic spiral conforms to the Golden Section ratio.

- 5 -

According to a preferred embodiment, the chamber is shaped to a logarithmic curve configuration.

According to a preferred feature of the invention, the logarithmic curve configuration conforms to the Golden Ratio.

- 5 According to a preferred embodiment, the expansion chamber comprises an entry section adapted to decelerate the gas flow and exit section adapted to accelerate the gas flow, both sections being configured in accordance with logarithmic curves conforming to the Golden Ratio,

10 The invention will be more fully understood in the light of the following description of several specific embodiments.

Brief Description of the Drawings

The description is made with reference to the accompanying drawings, of which:

Detailed Description of Specific Embodiments

Each of the embodiments is directed to a duct which provides a fluid pathway which can be utilised to convey a fluid.

15 As stated previously, it has been found that all fluids when moving under the influence of the natural forces of Nature tend to move in spirals or vortices. These spirals or vortices generally comply with a mathematical progression known as the Golden Ratio or a Fibonacci like Progression.

20 Each of the embodiments serves to, in the greater part, enable fluids to move in their naturally preferred way, thereby reducing inefficiencies created through turbulence and friction which are normally found in apparatus commonly used for propagating fluid flow. Previously developed technologies have generally been less compliant with natural fluid flow tendencies.

- 7 -

The greater percentage of the surfaces of the ducts of each of the embodiments described herein are generally designed in the greater part, in accordance with the Golden Section or Ratio and therefore it is a characteristic of each of the embodiments that the duct provides a fluid pathway which is of a spiralling configuration and which conforms at least in greater part to the characteristics of the Golden Section or Ratio. The characteristics of the Golden Section are illustrated in Figure 1 which illustrates the unfolding of the spiral curve according to the Golden Section or Ratio. As the spiral unfolds the order of growth of the radius of the curve which is measured at equiangular radii (eg E, F, G, H, I and J) is constant. This can be illustrated from the triangular representation of each radius between each sequence which corresponds to the formula of $a:b = b:a+b$ which conforms to the ratio of 1:0.618 approximately and which is consistent through out the curve.

It is a characteristic of each of the embodiments that the curvature of the surfaces which form the duct takes a two dimensional or three dimensional shape equivalent to the lines of vorticity or streak lines found in a naturally occurring vortex, and which substantially or in the greater part conform to the characteristics of the Golden Section or Ratio and that any variation in cross-sectional area of the fluid pathway also substantially or in greater part conforms to the characteristics of the Golden Section or Ratio. Furthermore it has been found that the characteristics of the Golden Section or Ratio are found in nature in the form of the external and internal configurations of shells of the phylum Mollusca, classes Gastropoda and Cephalopoda and it is a common characteristic of at least some of the embodiments that the fluid pathway defined by the duct corresponds generally to the external or internal configuration of shells of one or more of the genera of the phylum Mollusca, classes Gastropoda and Cephalopoda.

It has been found that it is a characteristic of fluid flow that, when it is caused to undergo a fluid flow through a pathway having a curvature substantially or in greater part conforming to that of the Golden Section or Ratio that the fluid flow over the surfaces is substantially non-turbulent and as a result has a decreased tendency to

- 8 -

cavitate. As a result, fluid flow over the surface is more efficient than has been encountered in previous instances where the pathway does not substantially or in greater part correspond to that of the Golden Section. As a result of the reduced degree of turbulence which is induced in the fluid in its passageway through such a pathway, the ducts according to the various embodiments can be used for conducting fluid with less noise, wear and with a greater efficiency than has previously been possible with conventional ducts of equivalent dimensional characteristics.

A first embodiment shown in Fig. 3 and Fig. 4 relates to a duct section which facilitates the change in direction of fluid or fluid pathways within plumbing or ducting systems such as water pipes or air conditioning systems.

As can be seen in Fig. 2, a conventional right angle bend (30) in pipe or ducting results in fluid flow that is less than optimal. Streamlines show a low-pressure area (31) and a high-pressure area (32). This can result in turbulence, cavitation, sedimentation and corrosion as well as increasing energy losses in the fluid movement (34). This can result in increased pumping costs and reduced pressure at the outlet.

This form of the embodiment shown in Figures 3 and 4 provides a duct (36) specifically designed to induce the fluid (34) to move in accordance with the laws of Nature whilst changing its direction. As mentioned previously, the duct is designed having a pathway having a curvature (37) substantially or in greater part conforming to that of the Golden Section or Ratio. The fluid is thereby induced into vortical flow (35) the greater part of which conforms to the Golden Section or Ratio.

While the first embodiment illustrates the considerable advantages to be gained from a duct designed in accordance with the principles discussed above where there is a discontinuity in the flow of the fluid being conveyed, advantages are available even where the flow is substantially linear.

A second embodiment shown in Figures 5 and 6 relates to a duct (41) providing a twisting pathway (42) for fluids where the pathway conforms to the Golden Section or Ratio. As fluid (43) flows through the inside (44) of the duct, it is urged to conform to natural flow spiral characteristics, which minimize extraneous turbulence.

5 In an adaptation of the second embodiment, there is provided a flow controller having the form as shown in Figure 5 and 6, the flow controller adapted to be located within a fluid pathway. In this form the flow of the fluid is around the outside of the flow controller. It is therefore the external surface of the flow controller which is active and is designed to conform to the Golden Section. However, in this
10 adaptation, the flow controller may be hollow which allows the fluid to flow through it internally.

A third embodiment shown in Figure 7 depicts a duct (51) providing a twisting pathway (52) for fluids conforming to the Golden Section or Ratio. As fluid (53) flows through the inside or outside of the duct it is urged to conform to natural flow
15 spiral characteristics, which minimize extraneous turbulence. Additionally, the diagram shows the fluid's spiralling flow path on the fluid as it flows.

An example of a duct constructed in accordance with the third embodiment is a cardiovascular stent. Conventionally, stents have been cylindrical in shape. While intended to be permanently placed within the patient, it has been found in many
20 cases, that fatty deposits are formed within the stent over a period of time, requiring their replacement. It is believed that this build up is caused as a result of the turbulence in the stent. A stent constructed in accordance with the third embodiment will avoid this turbulent flow and thereby prevent the formation of fatty deposits in the stent.

25 The fourth embodiments as shown at Figure 8, 9, 10 and 11 each comprises a fluid flow controller 118 which generally takes the form of a shell of the phylum Mollusca, class Gastropoda, genus Volutidae as shown at Figures 8 and 9 and 10 and 11

- 10 -

where the inner end of the shell is cut away as shown to provide an entry (121) into the interior of the shell. The mouth of the shell serves as the outlet (125) for the controller 118. Figures 10 and 11 show twin ducts. The controllers according to the fourth embodiments are placed along the fluid flow path to induce a fluid flow that 5 conforms with Nature.

A further embodiment relates to a muffler or sound attenuator for a sound source such as an internal combustion engine. It also serves the function of a flame duct or tube to maximise fuel/air combustion and exhaust gas extraction from an internal combustion engine and / or the optimum extraction of energy via adiabatic 10 expansion.

The invention also has application to mufflers, flame tubes and exhaust systems.

A typical exhaust system will have a length of exhaust pipe extending from the engine for sufficient distance to provide an effective flame tube, a contained area in which gas turbulence is minimised and a harmonic is created. This then enters a 15 muffler which is usually a box or chamber with an inlet pipe and outlet pipe. There are baffles, or obstructions within the box which slow down the exhaust gases passing through the box. The box itself, being larger than the inlet pipe allows the exhaust gas to expand, thereby slowing the gas. These reductions in gas speed result in a reduction in noise.

20 Muffler systems of this type can suffer from operational difficulties and inefficiencies ie. the baffling and slowing of exhaust gases in this way causes turbulence and back pressure on the gas and therefore at exhaust of the engine, resulting in reduced performance and efficiency. For example, to maximise power output from an engine, racing cars and bikes have no mufflers on their exhaust systems but, 25 instead use tuned flame tube ducts which act as extractors of exhaust gases, thereby reducing turbulence and maximising engine power output as a result. They are, of course, very noisy. Inefficiencies of gas movement through turbulence may

- 11 -

be caused by a number of different reasons but is exacerbated by sudden or abrupt changes in direction or velocity of the gases passing through the muffler.

To this end, the flame tube / exhaust pipe may be applications of the flow controller of the second, third or fourth embodiments to thereby improve the efficiency of the system.

The muffler according to the present invention aims to overcome these problems by providing a muffler which acts as an expansion chamber configuration to reduce the severity of changes in speed or velocity of the gases passing through it, thereby reducing the noise in the system. The embodiment also seeks to take advantage of

natural fluid movement tendency which has been observed in Nature to generally form vortices which have a logarithmic spiral. These spiral expansion-contraction ratios, as used in the invention, also offer the path of maximum non turbulent adiabatic expansion for gases and therefore provides for greatest efficiency in steam expansion ducts/chambers.

In one form of the embodiment there is provided a rotational-formed expansion chamber which acts as a chamber or expansion tube. The duct is shaped and expanded to a logarithmic curve configuration. Preferably the logarithmic curve is arranged so that the entry of gas is at the fine end and the exit is at the coarse or wider end of the chamber.

Where the term logarithmic curve, or logarithmic progression has been used it is to be understood that any form of curve following a logarithmic progression is included within this definition, including so-called exponential configurations. Any curve which approximates an equiangular logarithmic curve is also included within the term "logarithmic curve" used in this specification.

Although many forms of logarithmic curve configuration for exhaust ducts may be used and may achieve desired effects, i.e. the reduction of cavitation and the more

- 12 -

efficient exhausting and silencing of gases and optimised adiabatic expansion, it is felt that the preferred logarithmic progression is that curve referred to as "the Golden Ratio" in which the logarithmic curve fits within a series of conjoint rectangles, each having their sides in the approximate proportion of 1:0.618.

5 The embodiment stems from a desire to decelerate the gases in an exhaust system in a manner in which is harmonious with the natural forms of movement of gases. The embodiment establishes largely singular, vortical flow with minimal counterproductive turbulence which is extraneous to main flow. It is also designed to optimise inherent flame tube/duct characteristics for the maximum combustion of
10 gases It has been observed that in nature that natural vortices of whirlpools have a shape which generally follows a logarithmic progression. The embodiment aims to move and decelerate the gases within an exhaust system duct by the use of vanes or expansion chambers formed to a logarithmic curve so that the gas is caused to decelerate or gradually at first followed by a progressively increasing change of
15 speed in a continual direction change approximating a Golden Ratio logarithmic progression. By acting on the working medium in this manner, the cause of sudden decelerations or radical changes of direction is reduced and the potential for turbulence and poor performance of the muffler/flame tube duct is also reduced.

Mufflers using a rotationally formed logarithmically expanding duct according to the
20 embodiment may be used in any suitable application for the expansion and/or muffling of gases, and even for the extraction of air and other gases, but typically finds application in internal combustion engine exhaust systems. In this application the gas can be induced through the entry to the duct system, decelerated smoothly using the logarithmic curved vanes and/or chambers, in harmony with the naturally
25 occurring responses of the gas, and ejected at low velocity to cause slowing and noise reduction of gases.

To this end a muffler may be provided in a large number of different configurations which are typified by the examples shown in the accompanying drawings.

- 13 -

In the form of the embodiment shown in Fig. 12 there is shown a muffler (218) / expansion chamber (211) having an entry section (221) and an exit section (225) in the form of a converging or diverging duct respectively. The muffler is shaped to follow a logarithmic curve having a fine pitch in the area (221) adjacent the inlet and 5 the relatively coarse pitch in the area adjacent the outlet (225). Gases forced into the inlet (221) are caused to slowly decelerate and rotate in a vortex movement, following a natural movement for gases.

In the configuration of the form of the embodiment shown in Figs 13, 14, and 15, the expansion chamber may be located within a shroud (411). The chamber has a 10 spiral wall orientated about an axis (423) and having an edge (425) from which the conical wall spirals inwardly in a manner following a logarithmic progression. The cross section of the cavity between adjacent walls increases outwardly in a logarithmic progression causing deceleration of the fluid within the cavity. Rotation of the gas in the chamber is in a clockwise sense (with regard to Fig. 8), inducted 15 through entry (415) and forced through the outwardly tapering spiral canals within the impeller until it is thrust out through the exit (425).

The spiral tube forming the expansion chamber (418) preferably has a relatively large cross-section at the outlet (425) and a relatively small cross-section at the inlet (423), from which gas is inducted at high velocity and caused to be ejected from 20 outlet (425) resulting in expanded, slowed noise, gas.

The configuration of the form of the embodiment of the chamber can be seen more clearly in Fig. 15 which is a typical view from the top of such a chamber from which it can be seen that the shape incorporates a logarithmic curve in its spiral configuration.

25 This logarithmic curve or spiral in the approximate ratio of 1:0.618 applied to chambers, vanes or ducts shaped according to this curve are able to operate in a harmonious manner with the natural movement of gas allowing these fluids to be

- 14 -

decelerated through a chamber or motor in a manner which is considerably more harmonious, and therefore efficient than that achieved in conventional mufflers, expansion chambers and flame tubes.

It is a common characteristic of each of the embodiments described above that they
5 can be used as a duct which can induce fluid flow in a non-turbulent manner
between an inlet and an outlet or alternatively which permits the passage of fluid
between the inlet and outlet in a substantially non-turbulent, more efficient manner
than has been possible with conventional ducts of equivalent capacity.

In addition it is a characteristic of the invention that the duct of the invention and
10 each of the embodiments can be used with gaseous, liquid and slurry forms of fluid
medium.

It is a further characteristic of the invention that the flow of fluid over the surface of
the duct results in significantly less friction and impact forces being imposed upon
the surface and the duct. As a result of this and the reduced turbulence created by
15 the duct there is less heat and noise generated as a result of the action of the duct
and thus imparted into the fluid.

It is a further characteristic of the invention that the induced vortical flow of the fluid
reduces sedimentation of materials in suspension on the walls of the duct.

It is a further characteristic of the invention that the reduced cavitation of liquids
20 result in reduced oxygenation and therefore reduced oxidization of the liquids or
duct construction materials.

It is a further characteristic of the invention that fluids may pass through it in reverse
flow to produce opposite effects.

Additionally, in the embodiments the inlet provides the minimum clearance for the
25 fluid entering the duct and as a result any materials which are able pass into the

- 15 -

inlet will be able to pass through the duct which reduces the possibility of the duct becoming clogged.

The duct of the invention has application to use in, among others: plumbing systems, refrigeration, circulatory piping or ducting systems, hot gas or refrigerant

5 gas expansion/contraction systems, afterburners, smoke stacks, flues, combustion chambers, air-conditioning ducts, dust precipitators, sound attenuators and mufflers, and can be used to advantage in any proposed application of such, at least because of the enhanced fluid flow, reduced friction, and reduced heat gain, reduced sedimentation, reduced oxidisation, and reduced noise.

10 It should be appreciated that the scope of the present invention need not be limited to the particular scope described above.

Throughout the specification, unless the context requires otherwise, the word

“comprise” or variations such as “comprises” or “comprising”, will be understood to

imply the inclusion of a stated integer or group of integers but not the exclusion of

15 any other integer or group of integers.

The claims defining the invention are as follows:

1. A fluid pathway provided with a flow controller in at least a portion of its length wherein the flow controller comprises an active surface capable of influencing the fluid flow through the pathway, the configuration of the active surface conforming to at least one logarithmic curve conforming to the Golden Section.
2. A fluid pathway as claimed at claim 1 wherein the curvature of the active surface is uni-dimensional.
3. A fluid pathway as claimed at claim 1 or claim 2 wherein the curvature of the active surface is bi-dimensional to define a three-dimensional surface conforming substantially or in the greater part to the Golden Section.
4. A fluid pathway as claimed at any one of the preceding claims wherein the active surface has a depth that can vary in accordance with the Golden Section.
5. A fluid pathway as claimed at any one of the preceding claims wherein the curvature of the active surface is transverse to the central axis of the fluid pathway.
- 15 6. A fluid pathway as claimed at any one of the preceding claims wherein the curvature of the active surface can be in a direction parallel to the central axis.
7. A fluid pathway as claimed at any one of the preceding claims wherein the curvature of the active surface is both transverse to the central axis and is parallel to the direction of the central axis to define a three-dimensional surface conforming substantially or in the greater part to the Golden Section.
- 20 8. A fluid pathway as claimed at any one of the preceding claims wherein the fluid pathway has a spiral configuration which takes the form of a logarithmic helix or a volute or whorl.

- 17 -

9. A fluid pathway as claimed at any one of the preceding claims wherein the cross-sectional area of the duct varies logarithmically substantially or in greater part in conformity to the Golden Section.
10. A fluid pathway as claimed at any one of the preceding claims wherein the active surface has the configuration conforming to the external configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
5
11. A fluid pathway as claimed at claim 10 wherein the active surface conforms to the external configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.
- 10 12. A fluid pathway as claimed at any one of claims 1 to 9 wherein the active surface has the configuration conforming to the internal configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
13. A fluid pathway as claimed at claim 12 wherein the active surface conforms to the internal configuration of shells selected from the genera Volutidea, Argonauta,
15 Nautilus, Conidea or Turbinidea.
14. A fluid pathway as claimed at claim 12 wherein the cross-section of the fluid pathway may increase or decrease between the inlet and outlet such that the variation in cross-section of the fluid pathway varies logarithmically substantially or in greater part in conformity to the Golden Section.
- 20 15. A fluid pathway as claimed at any one of the preceding claims wherein the active surface is adapted to cause rotational motion of fluid within the fluid pathway about the axis of flow of the fluid.
16. A flow controller adapted to be located in fluid pathway, the flow controller having an active surface adapted to influence the fluid flow, the configuration of the

- 18 -

active surface conforming to at least one logarithmic curve conforming to the Golden Section.

17. A flow controller as claimed at claim 16 wherein the curvature of the active surface is uni-dimensional.

5 18. A flow controller as claimed at claim 16 or claim 17 wherein the curvature of the active surface is bi-dimensional to define a three-dimensional surface conforming substantially or in the greater part to the Golden Section.

19. A flow controller as claimed at any one of claims 16 to 18 wherein the active surface has a depth that can vary in accordance with the Golden Section.

10 20. A flow controller as claimed at any one of claims 16 to 19 wherein the curvature of the active surface is transverse to the central axis of the fluid pathway.

21. A flow controller as claimed at any one of claims 16 to 20 wherein the curvature of the active surface can be in a direction parallel to the central axis.

15 22. A flow controller as claimed at any one of claims 16 to 21 wherein the curvature of the active surface is both transverse to the central axis and is parallel to the direction of the central axis to define a three-dimensional surface conforming substantially or in the greater part to the Golden Section.

20 23. A flow controller as claimed at any one of claims 16 to 22 wherein the fluid pathway has a spiral configuration which takes the form of a logarithmic helix or a volute.

24. A flow controller as claimed at any one of the claims 16 to 23 wherein the cross-sectional area of the duct varies logarithmically substantially or in greater part in conformity to the Golden Section.

- 19 -

25. A flow controller as claimed at any one of claims 16 to 24 wherein the active surface has the configuration conforming to the external configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
26. A flow controller as claimed at claim 25 wherein the active surface conforms to the external configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.
27. A flow controller as claimed at any one of claims 16 to 26 wherein the active surface has the configuration conforming to the internal configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
28. A flow controller as claimed at claim 25 wherein the active surface conforms to the internal configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.
29. A flow controller as claimed at claim 27 wherein the cross-section of the duct may increase or decrease between the inlet and outlet where the variation in cross-section of the duct varies logarithmically substantially or in greater part in conformity to the Golden Section.
30. A fluid pathway provided with a flow controller in at least a portion of its length wherein the flow controller comprises an active surface adapted to cause rotational motion of fluid within the fluid pathway about the axis of flow of the fluid.
31. A fluid pathway as claimed at claim 30 wherein the configuration of the active surface conforms to at least one logarithmic curve.
32. A fluid pathway as claimed at claim 15, 30 or 31 wherein the fluid pathway comprises a duct in the form of a cardiovascular stent.

- 20 -

33. A fluid pathway as claimed at claim 15, 30 or 31 wherein the fluid pathway comprises a duct in the form of a flame tube.
34. A muffler adapted to reduce the volume of noise propagating in a gas flow, the muffler comprising a fluid pathway in the form of an expansion chamber wherein 5 the expansion chamber is configured to induce a vortex in the gas flow, the vortex having a logarithmic spiral.
35. A muffler as claimed at claim 34 wherein the logarithmic spiral conforms to the Golden Section ratio.
36. A muffler as claimed at claim 34 or 35 wherein the chamber is shaped to a 10 logarithmic curve configuration.
37. A muffler as claimed at any one of claims 34 to 36 wherein the logarithmic curve configuration conforms to the Golden Ratio.
38. A muffler as claimed at any one of claims 34 to 37 wherein the expansion chamber comprises an entry section adapted to decelerate the gas flow and exit 15 section adapted to accelerate the gas flow, both section being configured in accordance with logarithmic curves conforming to the Golden Ratio,
39. A fluid pathway substantially as herein described.
40. A flow controller substantially as herein described.
41. A cardiovascular stent substantially as herein described.
- 20 42. A muffler substantially as herein described.
43. A flame tube substantially as herein described.

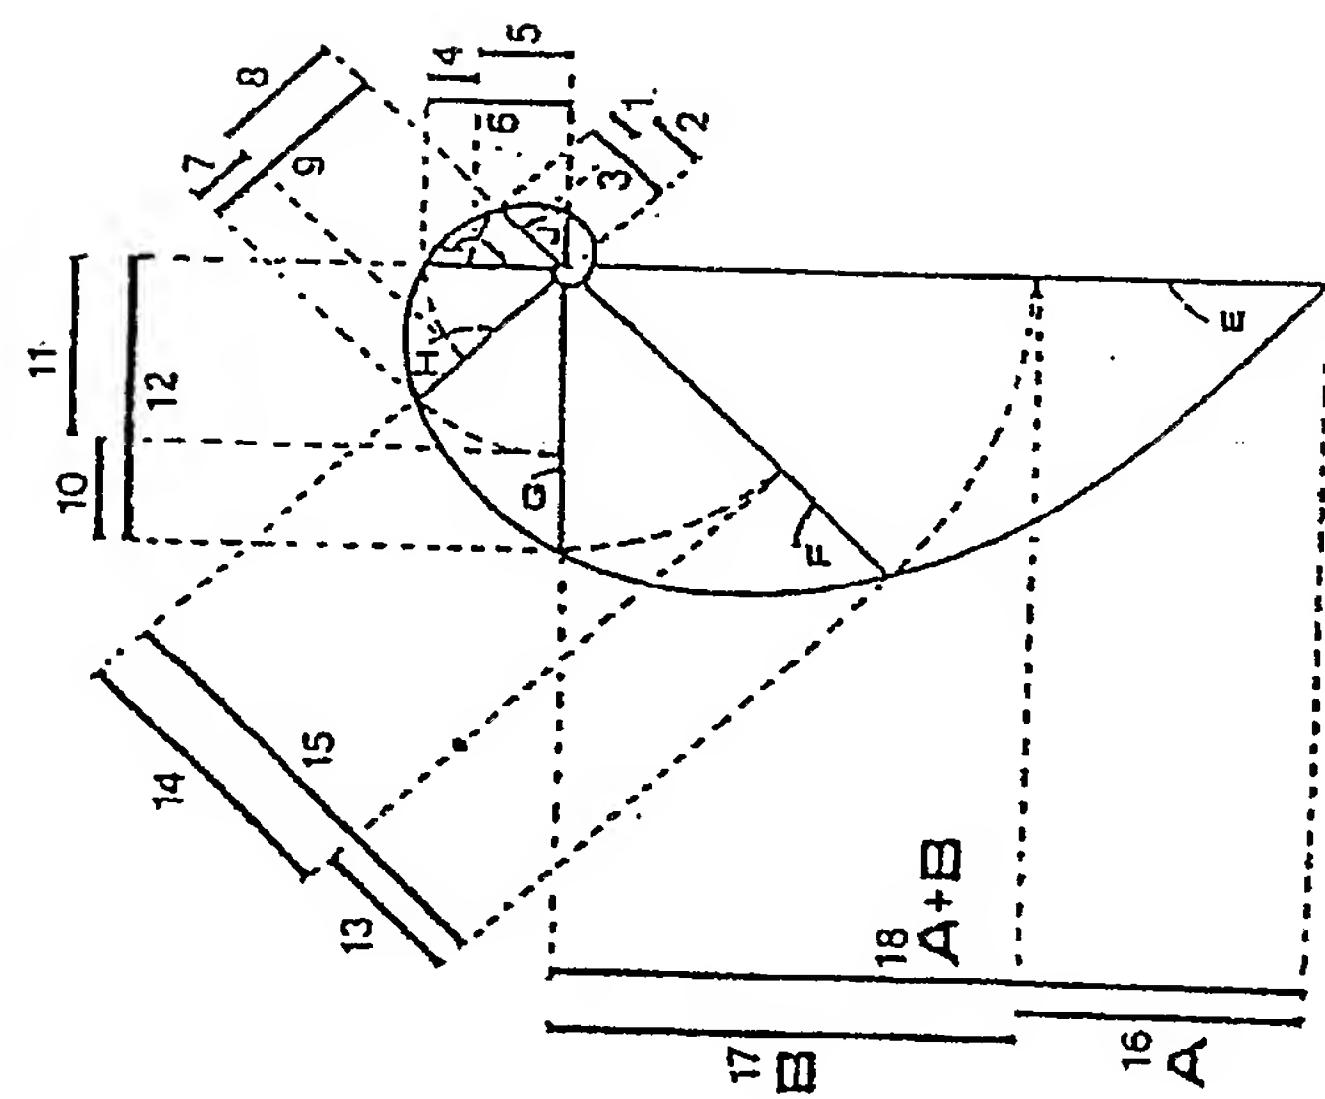

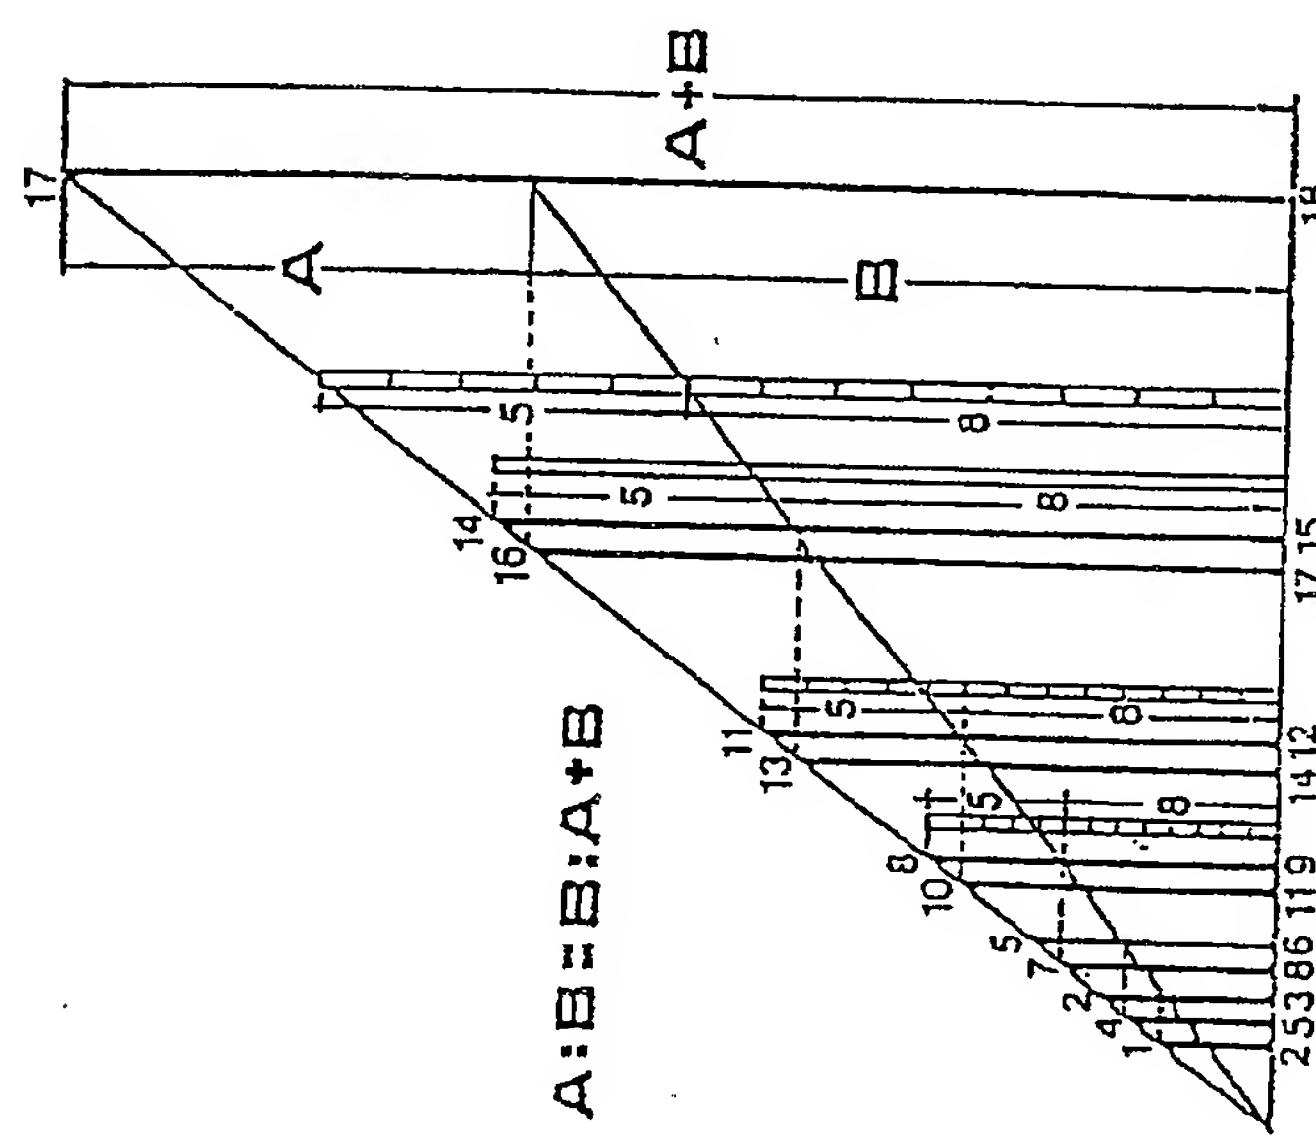

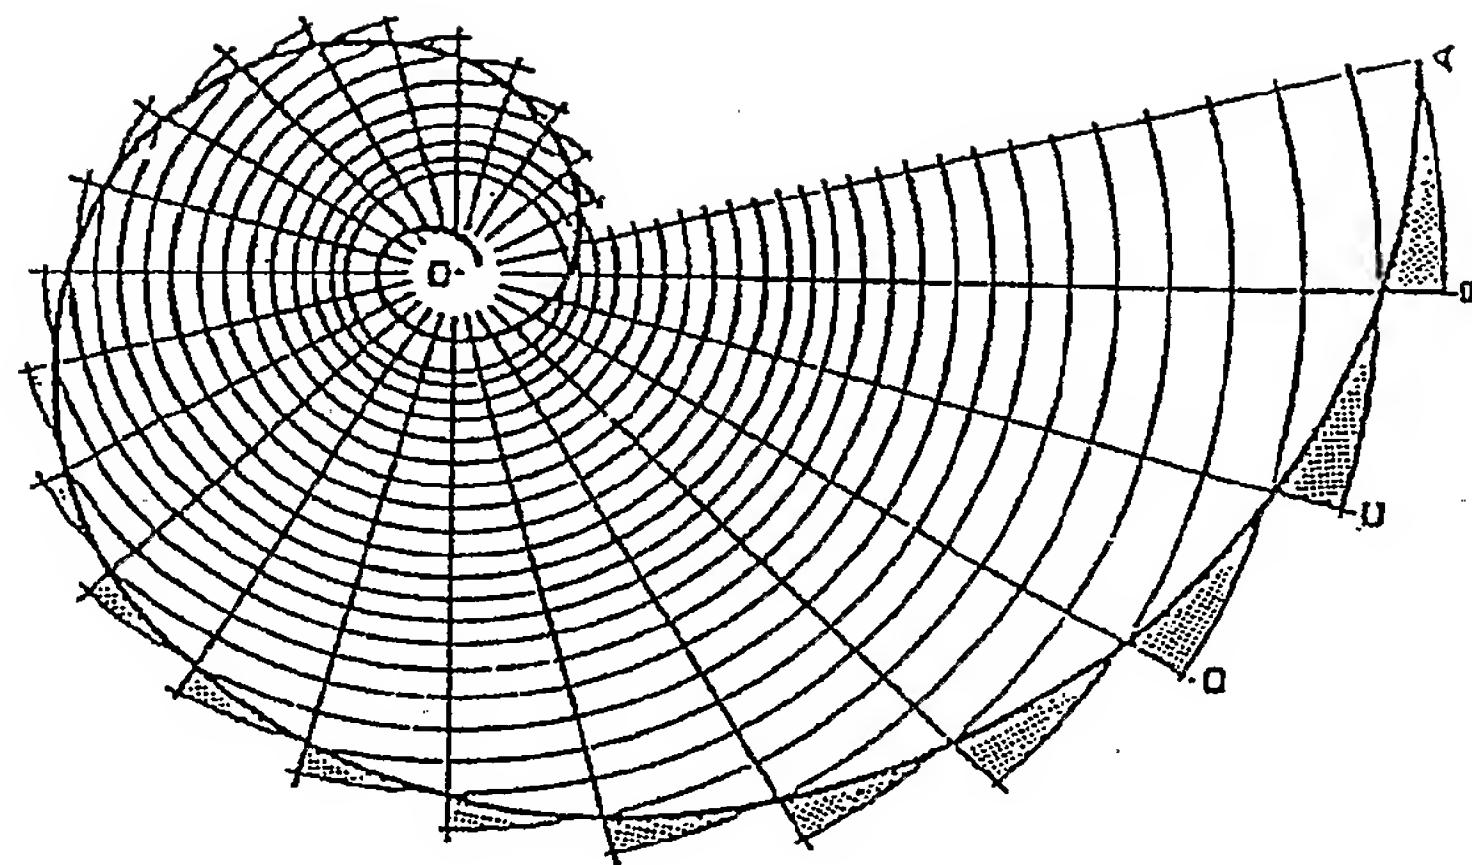

AMENDED CLAIMS

[received by the International Bureau on 24 March 2003 (24.03.03);
original claim 30 cancelled;
original claims 31, 32, 33 and 35 amended (2 pages)]

25. A flow controller as claimed at any one of claims 16 to 24 wherein the active surface has the configuration conforming to the external configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
26. A flow controller as claimed at claim 25 wherein the active surface conforms to the external configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.
27. A flow controller as claimed at any one of claims 16 to 26 wherein the active surface has the configuration conforming to the internal configuration of a shell of the phylum Mollusca, class Gastropoda or Cephalopoda.
28. A flow controller as claimed at claim 25 wherein the active surface conforms to the internal configuration of shells selected from the genera Volutidea, Argonauta, Nautilus, Conidea or Turbinidea.
29. A flow controller as claimed at claim 27 wherein the cross-section of the duct may increase or decrease between the inlet and outlet where the variation in cross-section of the duct varies logarithmically substantially or in greater part in conformity to the Golden Section.
30. (Cancelled)
31. A fluid pathway provided with a flow controller in at least a portion of its length wherein the flow controller comprises an active surface adapted to cause rotational motion of fluid within the fluid pathway about the axis of flow of the fluid and wherein the configuration of the active surface conforms to at least one logarithmic curve.
32. A fluid pathway as claimed at claim 15 or claim 31 wherein the fluid pathway comprises a duct in the form of a cardiovascular stent.

33. A fluid pathway as claimed at claim 15 or claim 31 wherein the fluid pathway comprises a duct in the form of a flame tube.
34. A muffler adapted to reduce the volume of noise propagating in a gas flow, the muffler comprising a fluid pathway in the form of an expansion chamber wherein the expansion chamber is configured to induce a vortex in the gas flow, the vortex having a logarithmic spiral.
35. A muffler as claimed at claim 34 wherein the logarithmic spiral conforms to the Golden Section ratio.
36. A muffler as claimed at claim 34 or claim 35 wherein the chamber is shaped to a logarithmic curve configuration.
37. A muffler as claimed at any one of claims 34 to 36 wherein the logarithmic curve configuration conforms to the Golden Ratio.
38. A muffler as claimed at any one of claims 34 to 37 wherein the expansion chamber comprises an entry section adapted to decelerate the gas flow and exit section adapted to accelerate the gas flow, both section being configured in accordance with logarithmic curves conforming to the Golden Ratio.
39. A fluid pathway substantially as herein described.
40. A flow controller substantially as herein described.
41. A cardiovascular stent substantially as herein described.
42. A muffler substantially as herein described.
43. A flame tube substantially as herein described.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/AU03/00004

A. CLASSIFICATION OF SUBJECT MATTER																						
Int. Cl. ⁷ : F16L 55/02, 55/027, 55/033, 55/04, 55/045, 55/07.																						
According to International Patent Classification (IPC) or to both national classification and IPC																						
B. FIELDS SEARCHED																						
Minimum documentation searched (classification system followed by classification symbols) IPC F16L 55/02, 55/027, 55/033, 55/04, 55/045, 55/07.																						
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched AU IPC F16L 55/02, 55/027, 55/033, 55/04, 55/045, 55/07.																						
Electronic data base consulted during the international search (name of data base and, where practicable, search terms used) DWPI (IPC F16L/IC AND (GOLD+,FIBONACCI,LOGARITH+,CURV+,SHELL+,SPIR+,HELI+,VOLUT+,WHORL+,WHIRL+) AND (TURBUL+,CAVIT+,NOIS+,DEPOSIT+CORRO+,RESIST+))																						
C. DOCUMENTS CONSIDERED TO BE RELEVANT																						
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.																				
X	Derwent Abstract Accession No. 97-198067/18, Class Q42, JP 09053787 A (KAJIMA CORP) 25 February 1997 See entire abstract.	30																				
X	Derwent Abstract Accession No. 97-546288/50, Class Q67, JP 09264462 A (SEKISUI CHEM IND CO LTD) 7 October 1997 See entire abstract.	30																				
X	Derwent Abstract Accession No. 1999-380417/32, Class Q67, JP 11148591 A (TLV CO LTD) 2 June 1999. See entire abstract.	30
